

# POWER TRIP PART III

## TRANS MODS AND A KILLER STREET/ STRIP TORQUE CONVERTER

BY RICK JENSEN  
PHOTOGRAPHY BY THE AUTHOR

Last time out, my big-horse LC2 build had progressed to the point where I could ship it from Florida to Ron's Custom Auto in Jersey for final assembly and installation into my awaiting 1987 Turbo-T. Though the engine sat expectantly in a corner of the shop, I decided to take a break from the motor build as my brand-new Precision Industries torque converter had arrived.

With my TR being a street/strip ride, I wanted to be able to up the stall speed for the bigger turbo and retain the converter lockup function on the street for better mileage and lower revs—that's a no-brainer that many converters, including the 10.5-inch lock-up unit currently in my 200-4R, are capable of.

But I also wanted this high-powered Buick to be able to abuse the hell out of the converter without it flinching, as well as lock it up at WOT for the best performance possible—and for that, I would need a multi-disc Vigilante.

The secret to this WOT lockup madness is the multiple clutch discs used in this converter. Guys with near-stock Turbo Buicks tapped into this trick for years with the factory 12-inch converter—and picked up some decent ET as well. Trouble is, the stock-type lock-up clutch in most converters isn't built to take this kind of abuse, and at the kind of power level I'm shooting for, it would be stupid to even try it—except with Precision's three- or five-disc offerings. I chose a five-

disc, 9.5-inch unit for maximum reliability.

Correctly sizing the turbo and torque converter can be tricky, especially if the Buick will be used in a street/strip capacity. Based on the size and type of the turbo I chose, as well as my goals at the drag strip, I requested a Vigilante with approximately a 3,300- to 3,500-rpm stall speed. The multi-disc option will enable me to lock up the clutch at WOT for additional gains, and I purposely made the stall a couple hundred rpm higher just in case I wanted to try a bigger turbo

down the road.

However, choosing the multi-disc meant installing a pump kit into the trans. The 200-4R is notorious for cross-leaks in the valve body, and a pump kit ensures better clutch apply. This is not extremely complicated, but I thought it was best to leave it to a pro—enter Dynotech's Eric Schertz. Since he built my 900-horse-capable Hi-Pro transmission, he was the right man for the job. Follow along to see how it's done. ■

*Here's how the Hartline LC2 looked when it got to Ron's Custom in New Jersey. It's very close to being completed and I will be putting the finishing touches on it soon. But for now it's time to concentrate on the torque converter and a necessary transmission mod.*

*The Vigilante multi-disc converter is a really high-tech piece: the five-disc clutch features Precision's proprietary material, and allows ultra-powerful TRs to lock up the converter at WOT without any ill effects. A billet front cover provides the ultimate in strength—these converters are rated to 1,600 flywheel horses. Even the paint is trick: it's temp-sensitive to warn you when the fluid has been overheated. You get all this, with a 2-year warranty and one free stall speed adjustment, for \$397.*

Precision's \$60 pump kit works by taking fluid from the filter feed and diverting it to the lockup circuit for the multi-disc clutch.

You may remember that this Buick was the recipient of a Dynotech Performance Hi-Pro transmission rebuild a couple of years ago. As this unit has very few miles on it, only the pump kit mod and a converter change will be necessary to meet my 10-second goals. Dynotech's Eric Schertz is doing our pump kit install.

He began by draining the 200-4R of its fluid. Next, the 16 pan bolts are removed, along with the filter and lockup solenoid.

Seven 13mm pump bolts are removed so he can pull the pump out. You guys at home can use a prybar to access the pump through the holes in the case, gently "walking" it out. Next, he removes the pump gasket and front pump washer, and snap ring pliers make short work of the lockup valve assembly. Here's a shot of the pump filter cavity, where Eric will be drilling. He wedges a paper towel into it to prevent metal shavings from getting in.

A pump bolt is removed so the pump kit can be installed and tweaked, if need be.

Eric grabs a center punch to accurately mark where he'll be drilling.

A 9/32 bit is used to drill into the filter pickup cavity. Air or brake clean can be used to remove any residual shavings.

Next up is the 15/64 bit, and Eric repeats the process. Air is again used to clean out all debris.

The tube is now test-fit; Eric gently bends it to adjust the angle so it lines up with the pump's new hole.

With the hole in the pump and the tube bent correctly, he mixes up a batch of J-B Weld and applies the mixture to the underside of the tube and the area of the tube that slips into the filter cavity. No way this puppy is getting loose!

## POWER TRIP PART III

The tube's contact area is cleaned off, then Schertz tightens the original pump bolt to 18-20 ft-lbs.

# GM GEN III POWER BY DESIGN

The new Pro Elite™ Gen III Cylinder Heads by RHS™ feature the latest in cylinder head design technology to unleash more hp from your LS-powered street and race vehicle. As part of the cutting edge Pro Elite™ series, these GM Gen III aluminum cylinder heads are fully CNC-machined for unmatched airflow and precision finishing quality. Best of all, RHS™ has teamed up with COMP Cams® to offer six new assembled head packages utilizing all top quality COMP Cams® components.

## Pro Elite™ Gen III Cylinder Heads

- 11° valve angle offers increased flow over the stock 15° valve angle without sacrificing piston-to-valve clearance
- Fully CNC-machined runners and combustion chambers for maximum volume, atomization, and velocity
- Raised valve cover rail allows higher port roof, and aftermarket rocker arm systems can be used with stock valve covers without a spacer
- Accepts all Gen III intake manifolds, including the FAST™ LSX™
- Available in 210cc and 225cc intake runner sizes; standard 62cc combustion chamber can be milled down to 36cc for increased compression

• Valve cover gaskets	N/A	\$30
• Valvoline 10-40	N/A	\$10
• Oil filter	N/A	\$5

Part II Costs: **\$2,738**

• Pump kit	2004RPTK	\$60
• Precision torque converter	N/A	\$997

Part III Costs: **\$1,057**

**Total cost to date: \$8,446**

Barely discernable in this photo, the tube is visible in the upper right-hand corner of the cavity.

My 200-4R's newly modified pump with the kit installed.

Here we're working with a recently rebuilt trans with very few miles; if that's not the case, a new pump gasket, O-ring, seven pump washers, and a filter and pan gasket should be used during reassembly.

## POWER TRIP PART III

# THE TRUTH ABOUT VALVE SPRINGS

## THE DIFFERENCE IS BENEATH THE SURFACE.

Try to cut corners with a set of "low-buck" valve springs and chances are you'll get exactly what you pay for. You might even get some things you didn't pay for: tiny pockets of material impurities, called "inclusions," that are undetectable to the naked eye but which loom large under a high-powered microscope. These inclusions are directly responsible for 95% of all valve spring failures, failures that can lead to destructive piston-to-valve contact. When you stop to consider the cost of rebuilding a high-performance engine, it's clear that those low-buck valve springs might not be such a great buy after all.

Standard Spring Material

Super Clean™ Spring Material

*\*Under the microscope, impurities which lead to failure are clearly visible*

### What Is Super Clean™ Material?

COMP Cams® valve springs are produced from a patented steel material, which is only produced by a select group of licensed foundries throughout the world. Our metallurgists Eddy-Current test and microscopically inspect the raw spring material to continuously verify that it meets COMP Cams™ stringent standards for purity, tensile strength and chemical composition. Only after this rigorous, multi-phase evaluation does the material earn the right to wear the Super Clean™ label and be used in COMP Cams® valve springs.

### Added Processes Make A Difference

But Super Clean™ steel is only part of the story. Every COMP Cams® valve spring is created using the latest CNC coiling machinery, then stress-relieved, ground, deburred, shot-peened and heat-set prior to shipment. Processes that, although time-consuming and costly, produce a better product: making COMP Cams® Super Clean™ valve springs your best investment!

*\*Check out [www.compcams.com/beehive](http://www.compcams.com/beehive) for high-speed valve spring video footage.*

## GM Gen III Valve Springs

Part# 26921

Race-quality dual valve spring, designed to handle up to .650" lift.  
O.D. 1.300"  
Seat Load 135 @ 1.770"  
Open Load 400 @ 1.220"  
Retainer 754 (Ti)

Part# 26918

Best selling Beehive™ valve spring for severe-duty applications up to .600" lift.  
O.D. 1.055/1.290"  
Seat Load 130 @ 1.800"  
Open Load 318 @ 1.200"  
Retainer 772 (Ti), 774 (St)

Part# 26915

Revolutionary Beehive™ valve spring for mild street performance applications.  
O.D. 1.055/1.290"  
Seat Load 105 @ 1.800"  
Open Load 293 @ 1.200"  
Retainer 772 (Ti), 774 (St)

Engineered to Finish First.

Schertz reassembles in the reverse order that everything came off, and our pump kit-enhanced 200-4R is ready to accept the multi-disc Vigilante. "The most common mistakes with this modification are leaving the lockup solenoid bolts loose and not seating the lockup snap ring in its groove," Eric warns. Watch those areas and you'll avoid headaches.

Eric uses a pump bolt to guide the pump back on, then a rubber hammer and a screwdriver are used to get it into place.

Finally, Eric demonstrates how the new converter will slip on. I'll wait to install the Vigilante converter—tune in next time as I continue this Buick buildup.
